1 =====
2 PROJECT HEALTH REPORTING AGENT
3 STEP-BY-STEP GUIDE TO RUN ON WINDOWS
4 =====
5
6 This guide assumes you have unzipped the project folder somewhere
7 on your computer, e.g. C:\Users\YourName\Desktop\project-health-agent
8
9
10 -----
11 STEP 0: INSTALL PREREQUISITES (one-time only)
12 -----
13
14 1. Install Python 3.10 or newer
15     - Download: https://www.python.org/downloads/windows/
16     - During install, CHECK the box "Add python.exe to PATH"
17
18 2. Install Node.js 18 or newer
19     - Download: https://nodejs.org/en/download
20     - Use the default installer options
21
22 3. Confirm both installed correctly:
23     - Open PowerShell (search "PowerShell" in the Start menu)
24     - Type: python --version          (should print Python 3.10+)
25     - Type: node --version            (should print v18+ or higher)
26     - If either command is not recognized, restart your computer and
27       try again (this refreshes the PATH), then re-check.
28
29
30 -----
31 STEP 1: OPEN THE PROJECT FOLDER IN POWERSHELL
32 -----
33
34 1. Open File Explorer and navigate into the project folder
35     (the folder that contains setup.ps1, requirements.txt, agent\, etc.)
36
37 2. Click the address bar at the top, type "powershell", and press Enter.
38     This opens PowerShell already pointed at the correct folder.
39
40     (Alternative: open PowerShell normally, then run:
41       cd "C:\path\to\project-health-agent")
42
43
44 -----
45 STEP 2: ALLOW THE SETUP SCRIPT TO RUN (one-time only)

```

```
46 -----
47
48 By default, Windows blocks scripts downloaded from the internet.
49 Run this command to allow it for THIS PowerShell session only
50 (it does not change any permanent system setting):
51
52     Set-ExecutionPolicy -Scope Process -ExecutionPolicy Bypass
53
54 Press Enter. If asked to confirm, type Y and press Enter.
55
56
57 -----
58 STEP 3: RUN THE ONE-COMMAND SETUP SCRIPT
59 -----
60
61 In the same PowerShell window, run:
62
63     .\setup.ps1
64
65 This single command automatically does ALL of the following:
66
67     1. Creates a local virtual environment (.venv) so nothing is
68        installed system-wide
69     2. Installs all required Python packages
70     3. Runs the agent on the two real client projects (UniSan, Titan)
71        and writes their weekly reports
72     4. Runs the agent on the synthetic 4-week trend-demo dataset
73     5. Builds both executive PowerPoint decks
74
75 This step may take a few minutes the first time (installing
76 packages). Wait for it to finish – you'll see a "Done." message
77 followed by a list of output file locations.
78
79
80 -----
81 STEP 4: FIND THE OUTPUTS
82 -----
83
84 After setup.ps1 finishes, the following will exist in the project
85 folder:
86
87     outputs\weekly\week1\
88         -> Real client weekly reports (.md and .json)
89
90     outputs\weekly_demo\week1 through week4\
```

```
91     -> Synthetic trend-demo weekly reports
92
93     monthly_synthesis\Monthly_Executive_Presentation.pptx
94     -> Real client executive summary deck
95
96     monthly_synthesis\Trend_Demo_Presentation.pptx
97     -> Synthetic trend-demo executive deck
98
99     You can open the .pptx files directly in PowerPoint, and the .md
100    files in any text editor or Markdown viewer.
101
102    NOTE: These files are also already included pre-built in the zip,
103    so if you just want to review the output, you can open them
104    immediately without running anything.
105
106
107    -----
108    STEP 5 (OPTIONAL): TURN ON LIVE AI-GENERATED NARRATIVE
109    -----
110
111    By default the project runs fully offline using a rule-based
112    fallback for narrative text. To use live Claude AI reasoning
113    instead:
114
115    1. Get an API key from https://console.anthropic.com/
116    2. In PowerShell, before running any script, type:
117
118        $env:ANTHROPIC_API_KEY = "sk-your-key-here"
119
120    3. Then re-run:
121
122        .\setup.ps1
123
124    or any individual script (see Step 7 below).
125
126    This step is completely optional – the RAG scoring logic itself is
127    identical either way; only the written narrative changes.
128
129
130    -----
131    STEP 6 (OPTIONAL): RUN THE LIVE WEB DASHBOARD
132    -----
133
134    This is a bonus feature: a local website that shows both real
135    projects' live RAG status and auto-refreshes when you edit the data.
```

136
137 1. In PowerShell (inside the project folder), run:
138

139 pip install -r requirements-dashboard.txt
140 cd dashboard
141 python app.py
142

143 2. Open your web browser and go to:

144
145 http://127.0.0.1:5000
146

147 3. Leave the PowerShell window open while using the dashboard.
148 To stop it, click back into the PowerShell window and press
149 Ctrl + C.
150
151

152 -----

153 STEP 7 (OPTIONAL): RUN INDIVIDUAL PIECES MANUALLY

154 -----

155
156 Use this only if you want to run one specific part instead of the
157 full setup.ps1 script, or if you're debugging something.
158

159 A) Run the weekly agent for ONE project:

160
161 cd agent
162 python run_weekly.py --tasks ../data/project_plans/unisan_tasks_current.csv --update ../data/project_plans/unisan_current_update.csv --project "UniSan S2P Implementation" --as-of 2026-07-02 --out ../outputs/weekly/week1
163 cd ..
164

165 B) Run the weekly agent for BOTH real projects at once:

166
167 cd agent
168 python run_current_projects.py
169 cd ..
170

171 C) Run the synthetic 4-week trend-demo dataset:

172
173 cd agent
174 python run_trend_demo.py
175 cd ..
176

177 D) Build the monthly executive decks (after weekly reports exist):

178
179 cd monthly_synthesis

```
180     python synthesize.py
181     python synthesize.py --demo
182     npm install
183     node build_deck.js monthly_summary.json Monthly_Executive_Presentation.pptx
184     node build_deck.js demo_summary.json Trend_Demo_Presentation.pptx
185     cd ..
```

```
186
187 E) Run the optional weekly scheduler (automation bonus):
188
```

```
189     pip install APScheduler
190     python agent\scheduler.py
191
192
```

```
193 -----
194 TROUBLESHOOTING
195 -----
```

```
196
197 "python is not recognized as an internal or external command"
198 -> Python isn't on PATH. Reinstall Python and check "Add python.exe
199     to PATH" during setup, then restart PowerShell.
```

```
200
201 "node is not recognized as an internal or external command"
202 -> Node.js isn't installed or PATH wasn't refreshed. Reinstall
203     Node.js, then close and reopen PowerShell.
```

```
204
205 "running scripts is disabled on this system"
206 -> Run this first, then try .\setup.ps1 again:
207     Set-ExecutionPolicy -Scope Process -ExecutionPolicy Bypass
```

```
208
209 "Cannot find module 'pptxgenjs'"
210 -> Run "npm install" inside the monthly_synthesis folder before
211     running node build_deck.js.
```

```
212
213 Port 5000 already in use (dashboard step)
214 -> Close any other program using port 5000, or stop any previous
215     "python app.py" process (Ctrl + C in its PowerShell window),
216     then try again.
```

```
217
218 =====
219 END OF GUIDE
220 =====
```

```
